

Bloom

Bloom is a Flutter + Firebase mental health and self-care app designed for people who want a lightweight way to check in with their mood, reflect in a journal, calm down with guided exercises, and review simple trends over time.

It is not a replacement for therapy, diagnosis, or emergency support.

What Bloom is for

Bloom focuses on everyday stress, low mood, anxiety, and habit building for students and early-career professionals who want short, low-friction self-help tools rather than clinical treatment.

Core Features

Onboarding and Profile

- Simple onboarding that explains what the app does and what it does not do.
- Optional profile details such as name, avatar, language, and reminder preferences.
- Consent and privacy messaging that explains Firebase storage and user data control.

Daily Mood Check-In

- Quick mood logging with a small set of emotions such as stressed, anxious, calm, okay, and great.
- Optional tags like Study, Friends, Family, Sleep, and custom tags.
- Optional short notes for context.
- Mood history and trend views so users can notice patterns over time.

Guided Breathing and Meditation

- Short exercises such as box breathing, 4-7-8 breathing, and grounding sessions.
- A breathing reset flow that can map a selected state like anxious, tired, or overwhelmed to a suggested exercise.
- Audio-based or text-based guided sessions with play/pause and progress feedback.

Journaling

- Daily or ad-hoc journal entries with simple prompts.
- Mood-linked journaling so users can open a reflection prompt immediately after a check-in.
- Search and filter support by date or tags.

Analytics and Insights

- Mood trends, streaks, and simple statistics like most frequent moods or tags.
- Weekly or monthly summary cards.
- Gentle insights framed as reflections, not diagnoses.

Reminders and Notifications

- Optional reminders for daily check-ins.
- Optional breathing or reset reminders at chosen times.
- Configurable frequency with a compassionate tone.

Safety and Crisis Support

- A prominent help-now section that links to verified crisis support.
- Clear guidance that the app should not be used as a substitute for emergency care.
- Crisis support references for India such as KIRAN, Tele-MANAS, AASRA, and iCALL.

Safety and Privacy

Bloom is designed with clear boundaries:

- It does not diagnose conditions.
- It does not replace therapy or emergency services.
- It keeps data minimal and stores user records under authenticated user IDs.
- It should support data export and account deletion from settings.
- Any future AI suggestions should be labeled clearly and should never replace human help for high-risk situations.

Tech Stack

Layer	Technology
Framework	Flutter
Language	Dart
State Management	Riverpod
Dependency Injection	GetIt
Authentication	Firebase Auth
Database	Cloud Firestore
Core Firebase Setup	firebase_core
Audio Playback	just_audio
Audio Visualization	audio_waveforms
UI Helpers	carousel_slider
Connectivity	internet_connection_checker_plus

Project Structure

```
lib/  
├─ core/  
├─ features/  
└─ firebase_options.dart
```

```
|— init_dependencies.dart  
|— init_dependencies.main.dart  
|— main.dart
```

Setup

Prerequisites

- Flutter SDK
- Dart SDK
- Firebase project configured for Android and iOS
- Android Studio or VS Code

Run locally

```
flutter pub get  
flutter run
```

Optional checks

```
flutter test  
flutter analyze  
dart format .
```

Notes

- The app is intended for self-help and habit support.
- Users in distress should be directed to local emergency services or verified crisis helplines immediately.
